Quality decision-making skills are essential to becoming a prepared worker. Because of my development within my health science career and technical education program, I have had to analyze key facts, data and situations in order to provide the best care to my patients. By practically applying quick decision-making in first aid scenarios that require rapid prioritizing, I have ensured that the best possible results are achieved for those who need my care.

I believe career and technical education empowers students to take ownership of their own education by creating an enthusiasm for learning through meaningful hands-on experiences. Students are encouraged to evaluate their strengths and interests so they might discover their passions and seek improvement to become the leaders in their career fields.

I hope to deliver outstanding healthcare by serving the needs of my patients and upholding high moral and spiritual standards. I plan on attending college to study biochemistry in order to prepare for acceptance into medical school. I am highly interested in cardiology, where I will have the opportunity to care for the hearts of my patients. By implementing trust, compassion, stability, and hope, I will be a leader in my career field.
